

# 10 Proven Landing Pages Prompts

Copy any prompt, fill the [BRACKETS], send. Mined from 500+ hours of top Claude builders.

1

## Conversion Structure Build

Visual quality is now easy; the real differentiator is conversion-focused structure with a single message and one CTA per section.

Build me a landing page for [PRODUCT / OFFER] using this conversion structure in order: a hero with a hook and one clear value proposition (the thing they get), then a short explainer of what it does, then social proof / testimonials, then the value proposition in more detail, then ONE friction-reducing call-to-action. One message per section – if you ask someone to do more than one thing, they do zero.

2

## Deep Interview Before Building

Depth of answers at the interview stage determines landing-page quality — this is exactly why design skills ask ~13 questions.

Before you build my landing page, interview me deeply. Ask me, one question at a time: who exactly is the customer, a one-line description of the product, what mindset the visitor arrives in, the single primary action I want them to take, the voice and look I want, and the scope (hero-only or full-scroll). Don't start building until you've got real answers to all of them.

3

## Honest Conversion Critique

LLMs flatter their own code; a dedicated critique surfaces real conversion-killers like ambiguous CTA priority that you'd otherwise ship.

Do a brutally honest conversion audit of this landing page. Score it across cognitive load, decoration discipline, and visual hierarchy. Specifically flag any two equal-weight CTAs with ambiguous priority, competing background motion, and multiple clashing visual styles. Then give me 3 concrete fix directions ranked by impact – don't flatter the work.

4

## Hook Rewrite — Sell the Destination

Buyers care about the end result, not your features or tech; outcome-framed copy converts where feature lists race to the bottom.

Re-engineer the copy of this landing page for my target customer. I help [WHO] achieve [OUTCOME]. Write a value-based hook at the top, then three sections each addressing one of their biggest pain points (pain point, how we solve it, supporting visual). Then go back through and make all of it about selling the destination, not the journey – sell Maui, not the flights to Maui.

5

## Flood It With Proof

Buyers skim and take the average of what they see; overwhelming proof placed at the decision point removes the trust objection.

Add a proof section to this landing page placed right before the main CTA. Flood it with credibility – testimonials with real names, result graphs, screenshots, and client logos – then a single clear CTA underneath. Visitors skim, so the sheer visible volume of proof should answer 'why you?' before they ever reach the button.

6

## Free-Audit Lead Magnet Funnel

People are far more likely to take a free audit than to buy — the diagnostic warms cold traffic and captures the contact before the sale.

Instead of selling my offer directly, build a free-diagnostic landing page. The hook addresses the visitor's pain ('Frustrated that [PROBLEM]? Answer 8 quick questions and get a personalized roadmap in under 2 minutes – 100% free'). Capture name and email, store the answers, and set it up so a personalized result can be sent back.

7

## Interactive ROI Calculator

Interactive calculators convert better than a passive 'contact us' by letting prospects see their own numbers at the decision point.

Add an interactive ROI / lost-revenue calculator to my landing page as the call-to-action. The value proposition is: 'Find out how much money your [BUSINESS] is losing every month by not having [SOLUTION].' Ask 3–4 inputs ([QUALIFYING METRICS]), then on submit calculate and clearly display a dollar figure. Make it the single focal CTA of that section.

8

## Multi-Page Onboarding Form

A well-scoped one-question-per-page flow boosts completion, and once someone has invested effort answering, the next step feels obvious — higher conversion.

Build me a form-submission landing page, one question per page, with a progress bar at the top. Page 1 asks first name with an Enter-to-continue button, then last name, then email, then [REMAINING 5–9 ONBOARDING QUESTIONS]. After the final question, show a clean confirmation message. Make it polished and modern, and test that Enter advances each page.

9

## Hero With Composition Planned

An image generated without composition planning won't fit your layout — the prompt must reflect the intended text placement.

Help me plan the hero before generating any image. Decide where the dead space for my headline, nav, and CTA buttons should sit (left, center, or right). Then write me an image prompt for a 16:9 hero background with no text but deliberate empty space for that text block, and a wow factor. Keep the camera angle still so it tiles cleanly behind the copy.

10

## Test Every Interaction

Automates the laborious QA of form submissions and edge cases so the landing-page iteration loop stays fast and reliable.

Test every single interaction on this landing page in a headed browser so I can watch. Attack the contact form three ways – the happy path, edge cases, and validation errors. Note every bug, fix the actual page, and re-test until it all passes. Then package this into a reusable 'Form Tester' skill.

11

## Mine Reddit for the Real Pain Points

Jack's 3D framework starts with real audience research — sections built from the customer's actual top-3 pain points convert far better than copy invented from assumptions.

Before writing any copy, research my customer. My ideal customer is [WHO] and my offer is [OFFER]. Use web search to find what this audience actually complains about – on Reddit, in forums, in reviews. Pull their exact words and the 3 problems they mention most. Then build the landing page so each main section directly addresses one of those three pain points, using their language, not mine.

12

## With-You vs Without-You Comparison

A side-by-side before/after comparison makes the cost of inaction concrete — it sells the gap between where the visitor is and where your offer takes them.

Add a 'with you vs without you' comparison section to my landing page, placed after the explainer. Two columns: life without [MY OFFER] (the current painful reality) versus life with it. Frame the 'with you' side as a trifecta of gains – new income, time saved, and higher success rate – with specific numbers where I give them: [YOUR NUMBERS]. Make the contrast visual and impossible to skim past.

13

## Connect the Form to a CRM via Webhook

A landing page that doesn't pipe leads anywhere is useless — a webhook to your CRM turns every submission into a tracked, followed-up lead automatically.

My landing page form needs to send submissions to my CRM. Here is my inbound webhook URL: [WEBHOOK URL FROM GHL / ZAPIER / N8N]. Wire the form so every submission POSTs the data to that URL as JSON. Send these exact fields: [first name, last name, email, plus YOUR FIELDS]. Then run a test submission so I can confirm the data arrives and the field names map correctly.

14

## VSL Page for Cold Traffic

VSL pages built for cold traffic strip away every choice except 'watch then book' — one avatar callout, one mechanism, one CTA is the proven cold-traffic formula.

Build me a clean video sales letter (VSL) landing page for cold ad traffic. Layout: one short headline calling out [MY AVATAR], my embedded video below it, then four tight text blocks — the unique mechanism (why my approach is different), the X to Y to Z outcome, a flood of proof, and frequently-doubted objections answered. End with ONE single CTA: a Cal.com / Calendly booking button. No nav bar, no distractions, one path only.

15

## Personalized Post-Signup Dashboard

A personalized post-signup dashboard turns a dead-end thank-you page into an instant 'this was built for me' moment — it raises perceived value and primes the next step.

After someone completes my onboarding form ([8 ONBOARDING QUESTIONS]), I want them to land on a personalized dashboard instead of a generic thank-you page. Store their answers in a database, then build a dashboard with 8 sections that each reflect one of their answers back to them with a tailored recommendation. Generate the SQL to create the table, set up the storage, and build the dynamic dashboard page.
