

10 Proven Video Prompts

Copy any prompt, fill the [BRACKETS], send. Mined from 500+ hours of top Claude builders.

1

Storyboard Before Generating

Individual scenes must map to individual videos and starting images; talking through a shot list architects 'verbal slop' into a directable plan.

I want to make an AI video about [YOUR CONCEPT]. Before generating anything, help me storyboard it: break the concept into 3 acts and about 10 specific scenes. Each scene should be one video clip traceable back to one starting image. Keep it simple – don't overcomplicate it. Give me the shot list first and wait for my approval.

2

Lock a Foundation Image

Everything flows from the foundation image — every scene and keyframe references it for consistency; realism cues kill the plastic AI look.

Create my foundation image — the single image every scene will reference for consistency. Here's a detailed description: [SUBJECT / SCENE]. Include cinematic technical language and realism cues: shot on a cinema camera, shallow depth of field, visible pores and natural skin imperfections, ultra-realistic, no retouching, no skin smoothing. Generate 4 variations so I can pick the best one.

3

Start-Frame + End-Frame Formula

Feeding both frames lets the model fill the motion; simple continuous prompts with enhance off preserve quality and keep you in creative control.

I have a start frame and an end frame for a clip. Help me write a simple video prompt for the transition between them — keep it continuous and restrained, for example 'a continuous transition where [WHAT CHANGES] happens smoothly.' I'll feed both frames and your prompt into the video model. Do NOT make the prompt elaborate, and remind me to turn prompt enhancement OFF.

4

Cinematic Camera Vocabulary

Video models are trained on pro film vocabulary; without the right words you get the mediocre average output.

Write me a video prompt for this scene: [SCENE]. Use professional cinematography vocabulary — specify the camera, the scene, the subject, the action, the audio, and the style. For example frame it as 'low-angle tracking shot, 24mm anamorphic lens, slow dolly push-in.' Models are trained on real film language, so be specific and technical.

5

Only Use 2-3 Seconds

Like real film editing, you only use seconds of each take — finding the best 2-3 seconds dramatically cuts generation cost and time.

I generated this clip but it isn't perfect end to end. Help me review it: is there a clean 2-3 second window inside it that matches what I want? If yes, that's a win — we'll cut to just that window and move on to the next scene. Don't have me regenerate endlessly chasing a flawless full clip.

6

Edit Video as Code (Remotion)

Scene-level prompting means you never rebuild a video to fix one thing; Remotion treats every frame as code so edits are precise and live.

Set up this project as a video-editing studio. Install the Remotion skill, initialize a Remotion project, and run the dev server. I'll drop in a raw clip and a script. Edit at the scene level — for example 'in scene 3, the two text boxes overlap, fix that' — and changes should appear live in the editor. Plan the beat timeline before writing any animation code.

7

Word-Level Synced Motion Graphics

Precise word-level sync is what separates AI editing from amateur output; reviewing the timeline before HTML generation saves tokens.

I have a trimmed video. Transcribe it to a word-level transcript (a timestamp for every word). Then build me a beat timeline where each motion graphic is anchored to a specific word — for example, a graphic pops in exactly when I say '[WORD]'. Show me the beat timeline in plan mode so I can revise it before you write any animation HTML.

8

Trim Filler & Enhance Audio

Trimming filler first (before animating) and cleaning audio are the load-bearing steps; motion graphics must sync to the final word-level timestamps.

Here's a raw talking-head clip. First analyze the transcript to identify clean takes and cut all filler words, silences, double-takes and mistakes. Trim it down. Then run the audio through an enhancement pass — people forgive bad visuals but never bad audio. Show me the result before adding any graphics.

9

Build an Animated Explainer

One screen, one point keeps explainers clean; codifying the design system into a skill means consistent graphics on demand.

Create a short animated explainer video. First build a design system: educational style, minimal text, one point conveyed visually per screen, clean and simple (Kurzgesagt energy). Then make a [10-20 second] animation that illustrates exactly ONE point: [THE POINT]. Come back to me with a plan first. Once it's good, turn the whole thing into a reusable skill.

10

Build a Reusable Design-Philosophy File

Past projects become training data — the design-philosophy file is the unlock that turns video editing into a true drop-in-and-done automation.

I've made several videos now. Build me a 'video design philosophy' markdown file that captures my style — subtitle treatment, card style, color palette, pacing, the types of motion graphics I use. From now on, every time I drop in a raw video, use that philosophy file so I get end-to-end editing with minimal direction.

11

Generate the Whole Storyboard as One Grid

Generating all nine scenes in one grid keeps the character and style perfectly consistent across the whole story — far more reliable than prompting nine images one at a time.

Here is my foundation/character image. Generate a single 3x3 nine-scene narrative grid at high resolution — nine connected story moments that all keep this exact character and aesthetic. Lay them out like a comic-book page so I can see the whole story at once. Then I'll extract each cell as a separate reference image to drive its individual video clip.

12

Steal the Cinematic Language From a Real Film

Real films are the highest-quality reference for cinematic language; pulling a movie's exact shot type, lens, and lighting gives prompts a professional look the auto-enhancer can't.

I want this scene — [SCENE] — to feel like a still from [FILM OR DIRECTOR I ADMIRE]. Tell me, in concrete cinematography terms, what makes that film's look: the shot type, the lens, the lighting setup, the color grade, the camera movement. Then weave all of that into a single detailed image prompt for my scene. Be technical and specific — name the lens and lighting, not just a vibe.

13

Seamless Looping Background Video

Using one image as both first and last frame guarantees an invisible loop point — the standard trick for hero-section and ambient background video.

I need a seamless looping background video for [WEBSITE HERO / SOCIAL POST]. First generate a 16:9 still image of [THE SCENE]. Then use that same image as BOTH the first frame and the last frame of the video, with a simple prompt where the camera stays still and only [SUBTLE MOTION — e.g. steam rising, light shifting] happens. Turn audio off. Because the first and last frame are identical, it will loop with no visible cut.

14

AI Voiceover Script Chunking

Cloned-voice audio quality degrades past ~1 minute and avatar tools cap clip length; chunking at sentence boundaries keeps every segment sounding like you.

I'm using an AI voice clone to narrate this script. First split my script into chunks of about 45–60 seconds of speech each, and only ever cut at the end of a complete sentence – never mid-sentence. Then for each chunk give me clean, punctuation-tidy text ready to paste into the voice model. Number the chunks so I can stitch the audio back in order.

15

Reverse-Engineer a Winning Video Into a Reusable Prompt

Turning a proven winning video into a fill-in-the-blank meta-prompt lets you reproduce a working style on any new topic instead of guessing from scratch each time.

Here is a video clip (or a frame from one) that performed well and matches the style I want: [PASTE / DESCRIBE / LINK]. Reverse-engineer it into a reusable meta-prompt – break down its subject, composition, lighting, motion, pacing, and mood – written so that if I swap in my own topic [MY TOPIC], a video model would reproduce the same style and feel. Give me the meta-prompt as a fill-in-the-blank template.
