Installing Claude Code

You'll walk away with: Claude Code installed and open on your machine, signed in, ready to take its first prompt. About 3 minutes start to finish.

Two ways in. **Pick the desktop app.** It's the same Claude Code engine the pros use — same power, same settings — just with windows and buttons instead of a black terminal screen. Most members never touch the terminal and never need to.

- Beginner Prompt Pack
- The Undo Button — You Can't Bre...

1. Open [claude.com/download](#) in your browser.
2. Click **Download Claude Code** — pick **macOS** or **Windows** depending on your machine.
3. Open the file you just downloaded. On Mac, drag it to **Applications**. On Windows, run the installer.

4. Open the app. You'll land on a sign-in screen.
5. **Sign in** with your Claude account (same account as [claude.ai](#)). You'll see a clean window with one input box at the bottom. That's it — you're in.
6. **When it asks for a folder, create a new empty one** (call it `my-business`) and open it. That's your home base for everything you build in this course. Nothing needs to be inside it. Claude Code just wants a place to work.

CLI option (skip if unsure)

 **Only if you're already comfortable in a terminal.** Run `npm i -g @anthropic-ai/claude-code` , then run `claude` . Same engine, no windows. You can pick this up later — you don't need it today.

What beginners get wrong

- **Overthinking it.** There's no "environment setup," no SDK, no config file. Download, sign in, done.
- **Quitting at an error message.** Almost every install error is one click to fix. Screenshot it, post it in the community, move on. Someone else hit the same error yesterday — the fix takes seconds once another human sees it.
- **Thinking you must choose the terminal to be a "real" builder.** You don't. The app and the terminal share the same engine and the same settings, with no power difference. Start with whichever you like. We point you to the app simply because it's the easier on-ramp.

Quick troubleshooting (95% of install issues fit here)

- **"Sign-in keeps failing."** Sign out of [claude.ai](#) in your browser first, then try the app sign-in again. Token mismatches resolve immediately.
- **"App opens but is blank."** Quit the app fully (Cmd-Q on Mac, right-click → Quit on Windows/Linux). Then restart it.

→ **Open.** The first time always asks for explicit consent.

- **"Git is required for local sessions."** You did nothing wrong. Git is a free tool Claude Code uses behind the scenes to save snapshots of your work (it powers the undo button). On Mac: open the Terminal app, type `git --version` , press enter. Your Mac will print a note like `xcode-select: note: No developer tools were found, requesting install` - **that is**

not an error, it is your Mac offering to install the tools for you. A separate popup window will pop up asking to install the "command line developer tools" - it sometimes hides *behind* your Terminal window, so look for it. Click Install, wait a few minutes. (If no popup appears, type `xcode-select --install` and press enter to force it.) On Windows: download Git from git-scm.com and click through the installer with the default options. Then restart Claude Code and select your folder again, and `git --version` will show a version number.
