The Desktop App: No Terminal

 The Undo Button — You Can't Break Anything

You'll walk away with: permission to stop being careful — because before you build a single thing, you'll know that every change is reversible and you can always go back.

The most common reason people freeze at the terminal: **"What if I break something?"** Let's kill that right now, before your first build — because the fear is the only real obstacle, and it's based on something that isn't true.

You cannot permanently break anything here

Two safety nets are on by default:

- **/rewind** — Claude Code automatically saves a checkpoint *before every change it makes*. Type **/rewind** (or press **Esc** twice on an empty input) and you can roll back to any earlier point — restore the files, the conversation, or both. It's a time machine for your work, and it's already running.
- **Git** — a permanent "this worked" save you can always return to. You don't memorize commands; you just tell Claude **"commit this as a checkpoint"** and it's locked in.

So here's the rule for the whole course

Experiment freely. The worst case of anything you try is "go back to the last checkpoint" — minutes lost, never your project. Careful people learn slowly. You don't have to be careful; you have to know the undo button exists. It does. It's **/rewind**.
